The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                               Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR camplification of at least one DNA region of (I) that includes PML, using amplification of at least one beginn of (I) that includes PML, using ca template a DNA sample containing at least one segment of (I); and catermining the length of the resulting amplicon(s). Also described are: cample containing (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or predisposition to a disease, associated with a gene that includes one or include PML. The method is used to identify microsatellite markers, in a include PML. The method is used to identify microsatellite markers, in a consense and for predisposis of such diseases, especially prion diseases of diseases and for predisposis of such diseases, especially prion diseases of the tanscription factors. The method is simpler, quicker and hormones or transcription factors. The method is simpler, quicker and continually less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the sheep prion content (PFP) comprising a polymorphic microsatellite locus. genes that contain polymorphic microsatellite loci, useful for tying predisposition to disease, by amplification and determining Example 3; Page 30; 64pp; German. length of amplicons.

Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.

Example 3; Page 27; 64pp; German.

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are:

predisposition to a disease, associated with a gene that includes one or more PML; and predisposition to a disease, associated with a gene that include with and prediagnosis (M3) of diseases associated with gene that disclude PML. The method is used to identify microsatellite markers, in a diseases-related gene, that are associated with a predisposition to but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the cow prion protein (PrP) comprising a polymorphic microsatellite locus. method of determining (M2) microsatellite markers (MM) Sequence 24 BP; 12 A; 12 C; 0 G; 0 T; 0 U; 0 Other; Score 22.4; DB 1; Pred. New genotyping oligonucleotide, useful for detecting the presence, † absence or identity of single polynucleotide polymorphism in a nucleic acid sample.

Claim 1; Page 65; 83pp; English.

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to

assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNBs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a single nucleotide primer extension (SNPE) primer specific for a human SNP containing DNA seguence

Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.

Claim 6; Page 35; 52pp; English.

clover species. SSRs, also called microsatellites, rere based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs may be purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention The present invention relates to Simple Sequence Repeats (SSRs) from

Compounds that modulate the activity of a multiple lineage kinase protein treating a cell that contains MLK with a test compound and determining it the decreases or increases the activity of MLK and promotes cell survival or death. Compounds identified as having MLK modulating activity have applications as anti-neurodegenerative agents, antiinflammatory agents and anticancer agents and are potentially useful for treatment of neurodegenerative diseases (e.g. Alzheimer's, Huntington's and Parkinson's diseases, amyotrophic lateral sclerosis, ischaemia etc.) and amalignant cell growth. DLK was cloned for its use in pFLAG-DLK by using degenerate primers derived from the highly conserved VID and IX subdomains of PTK polypeptides. Two primers (AAZ93406, AAZ93407) were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying compounds that modulate multiple lineage.kinase proteins, useful e.g. for treating neurodegeneration or cancer, from their effect on survival or death of kinase-expressing cells.
                                                                                                                                                                                              Multiple linkage kinase; MLK; PYK; modulation; antiinflammatory;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an animal model for chondrodysplasia, more particularly, to a transgenic mouse model for achondroplasia. This transgenic mouse contains a fibroblast growth factor receptor 3 (FGFR3) gene including a G to A point mutation changing Gly to Arg in codon 380 in its genome. The transgenic mouse is useful as a model for FGFR-associated chondrodysplasia, particularly FGFR3 achondroplasia, e-g. shortening of the limbs, midface hypoplasia and large skull. This model may be exploited to gain better understanding of the disease and as an experimental model with which experimental therapy to chondrodysplasias can be exercised. The transgenic mouse is particularly useful as a tool for screening, developing and evaluating drugs with a potential of relieving or abolishing chondrodysplasia syndromes and/or symptoms. The present sequence is a PCR primer used to detect mouse FGFR3 allele
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New transgenic mice having a genetically modified fibroblast growth factor receptor gene, useful as a model for human chondrodysplasia, e.g. achondroplasia characterized by shortening of the limbs, midface hypoplasia or large skull.
                                                                                                                                                                                                                                                                                                                                                                                                            Mouse; chondrodysplasia; achondroplasia; transgenic mouse; therapy; fibroblast growth factor receptor 3; FGFR3; limb; midface hypoplasia; large skull; drug screening; drug development; transgenic; PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

A method for increasing the differentiation of undifferentiated central nervous system (CNS) cells in culture. This novel method involves culturing the cells in low ambient oxygen conditions. Differentiated CNS cells can be used to treat neurodegenerative diseases such as Parkinson's disease. In order to determine the differentiated phenotype messenger RNA levels can be measured using reverse transcription PCR. This involves using PCR primers specific to certain genes. The present sequence is the reverse PCR primer used to monitor the message level of FGFR3
                                                                                                                                                                                                                                                                                                                                                                   ö
                            Low oxygen culturing of central nervous system progenitor cells useful in treatment of neurodegenerative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is a PCR primer for the fibroblast growth factor receptor gane (PGPR3). It was used in reverse transcription PCR to determine expression patterns of the FGFR3 gene in cultured cells. These cells had been grown in low oxygen conditions, and had differentiated to form various types of neuronal cell. The different expression patterns can be used to determine which set of conditions promotes the differentiation of each type of neurone. The different cell types can be differentiation of each type of neurone. The different cell types can be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method for increasing the differentiation of undifferentiated central nervous system (CNS) cells in culture. This novel method involves culturing the cells in low ambient oxygen conditions. Differentiated CNS cells can be used to treat neurodegenerative diseases such as Parkinson's disease. In order to determine the differentiated phenotype messenger RNA levels can be measured using reverse transcription PCR. This involves using PCR primers specific to certain genes. The present sequence is the forward PCR primer used to monitor the message level of FGFR3.
                                                                                                                                                                                                                                                                                                                                                                 Low oxygen culturing of central nervous system progenitor cells useful in treatment of neurodegenerative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The present sequence is a PCR primer for the fibroblast growth factor receptor gene (FGFR3). It was used in reverse transcription PCR to determine expression patterns of the FGFR3 gene in cultured cells. These cells had been grown in low oxygen conditions, and had differentiated to form various types of neuronal cell. The different expression patterns can be used to determine which set of conditions promotes the used for tissue transplantation, to treat disorders such as stroke, brain and spinal cord injury, Alzheimer's disease, Huntington's disease, other neurodegenerative disorders, epilepsy, Parkinson's disease, neurological
used for tissue transplantation, to treat disorders such as stroke, brain and spinal cord injury, Alzheimer's disease, Huntington's disease, other neurodegenerative disorders, epilepsy, Parkinson's disease, neurological disorders and psychiatric disorders

The present invention relates to a method for identifying a genetic marker for spider lamb syndrome (SLS). The method comprising, obtaining a sheep DNA sample, and analysing the sample DNA with a probe to determine the presence or absence of a polymorphism in fibroblast growth factor receptor 3 (FGRN. The invention is used for diagnosting if sheep carry the gene for SLS, used to eliminate carriers of the syndrome from a flock. SLS or hereditary chondrodysplasia is a semi-lethal congenital disorder in sheep causing severe skeletal abnormalities. The present sequence is a PCR primer used to amplify sheep FGRR3 gene. The FGFR3 gene is located on chromosome 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying a genetic marker for spider lamb syndrome, used to diagnose if sheep carry a gene for the syndrome, involves analyzing sheep DNA samples for mutations in fibroblast growth factor receptor 3.
                                                                                                                                                                                                                             Sheep, spider lamb syndrome, SLS; fibroblast growth factor receptor 3; FGFR; hereditary chondrodysplasia; semi-lethal congenital disorder; severe skeletal abnormality; genetic marker; PCR primer; chromosome 6;

particularly for serotonin and dopamine, neuronal cell survival, and the electrophysicochemical properties of differentiated neuronal cells. Sequences AAI67692-721 represent gene-specific PCR primers for CNS and dopaminergic specific regulatory genes, used for examining the developmental progression of ES cells Lee S, 8XCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCX

```
The invention provides a method of culturing cells. The method involves expanding a culture of undifferentiated embryonic stem (ES) cells, cancural ing embryoid bodies (EB), culturing the bodies to select for central nervous system (CMS) precursor cells (PC), culturing PC in an expansion medium comprising a neurologic factor, and differentiating and culturing the expanded PC to form a culture of differentiated neuronal cells. The method is useful for culturing undifferentiated neuronal cells. The method is useful for culturing undifferentiated neuronal cells which are useful for treating a neurological disorder, especially Parkinson's disease in a patient. A gene product such as tyrosine hydroxylase, nerve growth factor (MDNF), brain derived neurorsphic factor (BDNF), bFGF, glial derived growth factor (GDNF) will a useful for culturing doppainergic and servicencegic neuronal cells. The differentiated neuronal cells are useful for treating neurological disorders such as Huntington's disease, alliance service disorders cincluding epilepsy, familial dysauchonomia as well as injury or trama to the nervous system such as neurotoxic injury or disorders cuch as stroke and CNS disorders resulting from aging. Assays are useful for developing drugs capable of regulating the survival, proliferation or developing drugs capable of regulating the survival, proliferation or developing drugs capable of regulating the survival, and a dispersive disorders of domains or neuronal cells and to screen for antagonist of for developing drugs capable of regulating the survival, and of and domain drugs capable of regulating the survival, and a disponders con the survival and contains the domain of and domain of the survival and contains the domain of the domain 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              dopamine or serotonin. Cell cultures comprising 50%-85% neurons which comprise 20-40% dopaminergic neurons and 1-3% astrocytes are useful for studying the mechanism of neurotransmitter synthesis and release,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Culturing cells such as neuronal cells for use in treating neurological disorders, comprises generating embryoid bodies from undifferentiated embryonic stem cells, selecting precursor cells, expanding and differentiating them.
                                                                                                                                                                                                                                                                                                                                                                      dopaminergic, cholinergic, serotonergic, antiparkinsonian, nootropic, neuroprotective, anticonvulsant, tranquilizer, vulnerary, neuroleptic, cerebroprotective, cell therapy, gene therapy, CNS, PCR primer, ss.
                                                                                                                                                                                                                                                                                                                              Cell culturing; embryonic stem; ES; central nervous system; FGFR3;
                                                                                                                                                                                                            Receptor FGFR3 cDNA amplifying forward primer.

The invention provides a method of culturing cells. The method involves expanding a culture of undifferentiated embryonic stem (ES) cells, generating embryoid bodies (EB), culturing the bodies to select for central nervous system (CNS) precureor cells (PC), culturing PC in an expanded PC to form a culture of differentiated neuronal cells. The method is useful for culturing undifferentiated neuronal cells. The method is useful for culturing undifferentiated ES cells to corn differentiated neuronal cells which are useful for treating a neurological disorder. especially Parkinson's disease in a patient. A gene product such as tyrosine hydroxylase, nerve growth factor (NGF), brain derived neurotrophic factor (BDNF), bFGF, glial derived growth factor. (GDNF) NT-3, and NT-4/5 can be introduced into a brain of a subject. The method is useful for culturing dopaminergic, cholinergic and subject. The method is useful for culturing dopaminergic, cholinergic for treating neuronal cells. The differentiated neuronal cells are useful for culturing dopaminergic, cholinergic for treating neurological disorders such as Hultiple sclerosis, severe seizure disorders including epilepsy, familial dysautonomia as well as injury or trauma to the nervous system such as neurotoxic injury or disorders of mood and behavior such as addiction and schizophrenia, cerebrovascular disorders such as stroke and CNS disorders resulting from aging. Assays are useful for developing drugs capable of regulating the survival, proliferation or genesis of neuronal cells and to screen for antagonist or agonist of dopamine or serotonin. Cell cultures comprising 50%-85% neurons which

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research
                                                                                                                                                                                                            ö
comprise 20-40% dopaminergic neurons and 1-3% astrocytes are useful for studying the mechanism of neurotransmitter synthesis and release, particularly for serotonin and dopamine, neuronal cell survival, and the electrophysiochemical properties of differentiated neuronal cells. Sequences AAI67699-721 represent gene-specific PCR primers for CNS and dopaminergic specific regulatory genes, used for examining the developmental progression of ES cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; antisense; fibroblast growth factor receptor 3; prophylaxis;

The present invention relates to a method of inducing differentiation of mammalian embryonic stem cells into functioning cells, which comprises culturing embryonic stem cells in a medium comprising leukaemia inhibitor culturing embryonic stem cells in a medium comprising leukaemia inhibitor factor and basic fibroblast growth factor. In particular, the invention comprises to the differentiation of murine embryonic stem cells. The method is useful for inducing differentiation of mammalian embryonic stem cells is useful for inducing discrete in pancreatic function, and in nerve function. Comparison particular parts of the present comparison of the present dispersely in neuronal degeneration (e.g. Alzheimer's disease and cells are useful not only for cell transplant therapy, but for in vitro colls are useful not only for cell transplant therapy, but for in vitro colls are useful or only for cell transplant therapy, but for in vitro cells are useful not safety evaluation of new drugs. The present sequence is function, and for safety evaluation of the invention
                                                                                                                                                                                                                     ö
reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is human FGFR-3 DNA specific PCR probe. This probe is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inducing differentiation of mammalian embryonic stem (ES) cells into functioning cells, for treating e.g. diabetes, comprises culturing ES cells in a medium containing leukemia inhibitor factor and basic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to novel isolated polypeptides and the DNA sequences which encode them. The invention may be useful for the development of compounds with a cytostatic activity (as NOX-agonists or antagonists) or vaccines. In addition, the disclosed sequences may be useful for gene therapy. The polypeptide is useful for preparing a composition for treatling or preventing a pathological state in a mammal, for example cancer or for chromosome mapping. The present sequence is that of a PCR primer which was used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               s MP, Li L, Spytek KA;

The invention relates to a method for inducing differentiation of mammalian embryonic stem (ES) cells into functioning cells. The method is useful for inducing differentiation of mammalian ES cells into functioning cells. The pancreatic islet-like cell clusters induced from alloganic ES cells are useful for treating a mammalian patient having disorders in pancreatic islet function, such as when the patient is a type I diabetic patient. The nerve-like cells induced from alloganic ES cells can be used for treating a mammalian patient having disorders in nerve function. The method is a lso useful in cell therapy. The present sequence is a reverse transcription (RT). PCR primer used to amplify mouse

This protein is used in a method which assays the ability of a substance to bind to a high-affinity heparin-binding growth factor (HBGF) receptor. The assay screens for potential antitumour agents that inhibit binding of HBGF to high-affinity receptors, or for potential wound healing agents that promote such binding. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                       Assays for high-affinity heparin-binding growth factor receptor ligands -using receptor-overexpressing cells or cell-free system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Potassium channel alpha subunit; K+alphaMI; pathological condition; neuronal disorder; Addison's disease; male reproductive disorder; infertility; metabolic disorder; diabetes; cardiac disease; congestive heart failure; wound; human; single nucleotide polymorphism; SNP; K+alphaMI.v2; ds.

                                                                                                                                                                                                                                                                                                                      The present invention relates to a new polymucleotide encoding potassium channel alpha subunit (KralphaM1) polypeptide. The KralphaM1 polymucleotides, polypeptides and antibodies are useful for diagnosing, preventing, treating or ameliorating a pathological condition or a susceptibility to a pathological condition such as neuronal disorders e.g. Addison's disease, male reproductive disorders e.g. infertility, metabolic disorders e.g. congestive heart failure, or wounds. The present nucleic acid sequence represents a single nucleotide polymorphism (SNP) oligonuclocitde, as described in the
                                                                                                                                                                                                                                  New polynucleotide encoding a potassium channel alpha subunit polypeptide or its variants, useful for diagnosing, preventing or treating a pathological condition e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Potassium channel alpha subunit; K+alphaM1; pathological condition; neuronal disorder; Addison's disease; male reproductive disorder; infertility; metabolic disorder; diabetes; cardiac disease; congestive heart failure; wound; human; single nucleotide polymorphism;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

channel alpha subunit (K+alphaMI) polypeptide. The K+alphaMI polymucleotides, polypeptides and antibodies are useful for diagnosing, preventing, treating or ameliorating a pathological condition or a susceptibility to a pathological condition such as neuronal disorders e.g. Addison's disease, male reproductive disorders e.g. infertility, metabolic disorders e.g. cardiac diseases e.g. congestive heart failure, or wounds. The present nucleic acid sequence represents a single nucleotide polymorphism (SNP) oligonucloeitde, as described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single mucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch.Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                          The present invention relates to a new polynucleotide encoding potassium channel alpha subunit (K+alphaM1) polypeptide. The K+alphaM1 polypeptide. The K+alphaM1 polynucleotides, plypeptides and antibodies are useful for diagnosing, preventing, treating or ameliorating a pathological condition or a susceptibility to a pathological condition such as neuronal disorders e.g. Addison's disease, male reproductive disorders e.g. infertility, metabolic disorders e.g. diabetes, cardiac diseases e.g. congestive heart failure, or wounds. The present nucleic acid sequence represents a single nucleotide polymorphism (SNP) oligonuclocitde, as described in the
                                                                                                                                                                        New polynucleotide encoding a potassium channel alpha subunit polypeptide or its variants, useful for diagnosing, preventing or treating a pathological condition e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polynucleotide encoding a potassium channel alpha subunit polypeptide or its variants, useful for diagnosing, preventing or treating a pathological condition e.g. diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Potassium channel alpha subunit; K+alphaMI; pathological condition; neuronal disorder; Addison's disease; male reproductive disorder; infertility; metabolic disorder; diabetes; cardiac disease; congestive heart failure; wound; human; single nucleotide polymorphism; SNP; K+alphaMI.v1; ds.

identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits aspected of being agammaglobulinaemia, diabetes insplains, lesch-Nyhan syndrome, muscular detrophy, familial hypercholesterolaemia, polycystic kidney disease, detrophy, familial hypercholesterolaemia, polycystic kidney disease, costeogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptomes of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune configuration, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and microorganism. The method is also useful in forensic investigations and configuration (SNPE) primer specific for a human SNP containing DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the apportification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PCR, selection; primers; OPTIPRIM; breeding; cattle; parentage; genetic mapping; traits; amplification; ss.

The sequence is that of a bovine microsatellite sequence obtd. by

screening a library of bovine Mbo! DNA fragments of between 250 and 500

cc bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50

cc clones cross-hybridised. Assuming independent distribution of

cc clones cross-hybridised. Assuming independent distribution of

cc microsatellites and Mbo! sites, the frequency of (T6)n >9 microsatellites

in the bovine genome is estimated at >100,000. The sequence Information

cc process 230 such bovine microsatellite is summarised in the

cp specification and indexed herein (see below). The sequences upstream and

cp specification and indexed herein (see below). The sequences upstream and

cc specification and indexed herein (see below). The microsatellites may be

cc cromated pcr primers for in vitro amplification of the corresp.

cc microsatellite (using the program OPTIPRIM). The microsatellites may be

cc used to identify individuals, for parentage testing, and in the genetic

cc mapping of economic trait loci, or genes involved the determinism of

cc economically important traits esp. in cattle, to allow selective

cc breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

One out of 50 and clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (TG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIRRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. ```
The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine ganome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information for ca. 230 such bovine microsatellite sequence were used to generate the sequence PR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                    The present invention relates to a method for synthesising a branched or multiply connected macromolecular structure, comprising oligonuclectide clamps (OC). The macromolecular structure is capable of specifically binding to a target molecule, and can therefore be used as probes. At least one OC comprises a target binding sequence that binds specifically and stably with the target molecule, and at least two OCs comprises signal generation molecules capable of generation adetectable signal in the presence of the target molecule. In addition the OCs are connected to one another by thioalkylamino, or thiophosphorylakylamino bridges. The present sequence is an OC used in the present invention
                              Synthesizing branched nucleic acids useful as diagnostic and molecular probes, involves combining first units having haloalkylamino groups and second units having thiol or phosphorothioate groups.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human NADPH quinone oxidoreductase 2 (NQO2) polymorphic sequence #44.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The sequences AAT66084-T66107 represent repeat sequences of low informativeness found in specific human genes. This repeat sequence is found in the human chromosomal clone SW13. The sequence is amplified by primers AAT66106-7. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                          Detection of polymorphic genetic markers of the form (dG-dA) n (dG-dT) n using novel nucleic acid mols. as primers.

                                                                                                        disorder-related traits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              peripheral
```

The sequence of a poly(GT) sequence found in the promoter of the gene encoding the natural resistance-associated macrophage protein (NRAMP) from mice (AAQ92940) or humans. The NRAMP protein controls the response of macrophages to pathogenic microorganisms. The DNA sequence encoding the NRAMP was isolated and cloned into plasmid pBabe lambda 8.1 which can be used for gene transfer to haematopoietic cells, specially in vitro to bone marrow or progenitor cells, in cases of NRAMP deficiency such as cancer. The full-length murine DNA can be used to isolate the human

analogue from a yeast artificial chromosome library (see AAQ92942)

Sequence 26 BP; 2 A; 2 C; 11 G; 11 T; 0 U; 0 Other;

New natural resistance associated macrophage protein - with N-terminal region contg. SH3 binding domain, also related nucleic acid, vectors, primers, antibodies etc., useful for diagnosis and treatment e.g. of

region contg. SH3 binding primers, antibodies etc.,

cancer.

SSR motif #20. Unidentified 25-MAY-2001. NZ509194-A.

The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNa. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs may are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches. Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

Table 7; Page 226; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the appecification and indexed herein (see below). The sequences upstram and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

ö used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGP) receptor 3 (also known as FGFR-3. ACH, JTF4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is human exemplification of the invention

The method comprishing, obtaining a sheep DNA sample, and analysing the sample DNA with a probe to determine the presence or absence of a polymorphism in fibroblast growth factor receptor 3 (FGFR). The invention is used for diagnosing if sheep carry the gene for SLS, used to eliminate carriers of the syndrome from a flock. SLS or hereditary chondrodysplasia is a semi-lethal congenital disorder in sheep causing severe skeletal abnormalities. The present sequence is a PCR primer used to amplify sheep FGFR3 gene. The FGFR3 gene is located on chromosome 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a genetic marker for spider lamb syndrome, used to diagnose if sheep carry a gene for the syndrome, involves analyzing sheep DNA samples for mutations in fibroblast growth factor receptor 3.
                                                                                                                                                                                                                                                                                                                                                                       Sheep, spider lamb syndrome, SLS; fibroblast growth factor receptor 3; FGFR; hereditary chondrodysplasia; semi-lethal congenital disorder; severe skeletal abnormality; genetic marker; PCR primer; chromosome 6;

Also described; (I) a stem cell (Al), derived from con-embryonic or post-natal animal cells or tissue, that is capable of con-embryonic or post-natal animal cells of endo-, ecto- or meso-dermal consideration and antinfilammatory activities, and can be used (A). (A) has osteopathic and antinfilammatory activities, and can be used considered from them, can be used to prevent or treat cellular. Confiferentiated from them, can be used to prevent or treat cellular. Configuration They can especially be used to rebuild periodontal cramplantation. They can especially be used to rebuild periodontal cramplantation of tooth extraction or skin lesions. They can also be used in a seaffold, for growing teeth (or associated bone) or attental expense or presents a por primer which is used in an example from the control or skin being the primer which is used in an example from the control or skin being the primer which is used in an example from the control or skin being the control or

The present invention describes a stem cell (A) that is obtained from non-
cembryonic tissue isolated from the dental follicle of a (wisdom) tooth
which can differentiate in vitro into a membrane structure that resembles
compendated ligament. Also described: (1) a stem cell (A1), derived from
compendated ligament. Also described: (1) a stem cell (A1), derived from
compendated and differentiation to cells of endo-, ecto- or meso-dermal
compendated and differentiation to cells of endo-, ecto- or meso-dermal
compendated (2) pluripotent mesonchymal stem cells (A2) obtained from
lineages; and (2) pluripotent mesonchymal stem cells (A2) obtained from
compendated (2) pluripotent mesonchymal stem cells (A2) obtained from
compendated from them, can be used to prevent or treat cellular
compendated from them, can be used to prevent or treat cellular
compendated from them, can be used to rebuild periodontal
compendated in cases of periodontitis) or dental cementum, and to improve
tissue (in cases of periodontitis) or dental cementum, and to improve
compendated from with a scaffold, for growing teeth (or associated bone) or
association with a scaffold, for growing teeth (or associated bone) or
present sequence represents a PCR primer which is used in an example from
the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compendation of the compenda
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cytostatic; NOVX-agonist; NOVX-antagonist; vaccine; gene therapy; cancer; chromosome mapping; human; PCR; primer; 88.

This primer and its 5' partner (AAQ52727) correspond to regions highly conserved among mouse BEK, human FLG and chicken fibroblast growth factor
                                                                                                                                                                                                        This invention relates to novel isolated polypeptides and the DNA sequences which encode them. The invention may be useful for the development of compounds with a cytostatic activity (as NOVX-agonists or antagonists) or vaccines. In addition, the disclosed sequences may be useful for gene therapy. The polypeptide is useful for preparing a composition for treating or preventing a pathological state in a mammal, for example cancer or for chromosome mapping. The present sequence is that of a PCR primer which was used in the exemplification of the
                                                                                                                        New NOVX polypeptide, useful for preparing a composition for treating or preventing e.g. cancer or for chromosome mapping.

                                                                                                                                                                                                                                                                                                             This invention relates to novel isolated polypeptides and the DNA sequences which encode them. The invention may be useful for the development of compounds with a cytostatic activity (as NoVX-agonists or antagonists) or vaccines. In addition, the disclosed sequences may be useful for gene therapy. The polypeptide is useful for preparing a composition for treating or preventing a pathological state in a mammal, for example cancer or for chromesome mapping. The present sequence is that of a PCR primer which was used in the exemplification of the
                                                                                                          Furtak K;

The invention relates to producing a Bur-Projucation of Academic acids (NAB) comprising contacting a NA sample from a physiological source, with a pool of 50 distinct gene specific primers under suitable confitions to enzymatically generate sub-population of NAB, where each cach labeled NA is generated using a single gene specific primer. The method is useful for producing a sub-population of Labeled NAB which is method is useful for analysing the differences in the RNA profiles between several different physiological sources, where the method comprises producing subpopulation of labeled NAB for the different physiological sources, comprising the populations for each physiological sources, comprising the population, where the comparison is preferably differences in the population, where the comparison is preferably differences in the population, where the comparison is preferably differences to an array of probe NAB stably associated with the surface of a substrate to produce a hybridisation pattern for each of the surface of a substrate to produce a hybridisation pattern for each of the surface of a substrate to produce a hybridisation pattern for each of the surface of a substrate to produce a normal tissue or. Gifferential gene expression assays are utilised in differential expression analysis of diseased a normal tissue or. Gifferential expression analysis of diseased a normal tissue or. Hoppen a sequence is a tissue, or different tissue or subtissue types. The present sequence is a the sequence data for this patent did not form part of the printed produce specification, but was obtained in electronic format directly from USPTO specification, but was obtained in electronic format

Sequences AAH17205 - AAH40944 represent PCR primers, single nucleotide polymorphisms SNPs. The present invention sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the coliponucleotides are useful for genotyping a nucleic acid sample a SNP flanking sequence, the SNPB primer is used as a genotyping primer. SNP flanking sequence, the SNPB primer extension reaction. The coliponucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The cliponucleotides are useful for determining the presence, absence or identity of a SNP and for genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include disease e.g. caused by one or more SNPs. Phenotypic traits include disease e.g. caused by one or more SNPs. Phenotypic traits include disease e.g. cateogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis of patennic microorganism. The method is also useful in forensic investigations and perminer extension (SNPE) primer specific for a human SNP containing DNA containing may and containing perfective or a containing perfective or a containing DNA                                                                                                                                                                                                                                         Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypertholesterolaemia; polycystic kidney disease; osteogenesis imperfects; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; primer; ss.

The invention relates to the ASTH1 locus on the short arm of human chromosome (11p). This locus comprises the ASTH1I and ASTH1I are not in trached in opposite directions with the ASTH1 locus, and have similar patterns of expression and common sequence motifs. They are both expressed in traches, lung and a sequence motifs. They are both expressed in traches, lung and several other tissues. ASTH1I and ASTH1I are novel members of the ets family of transcription factors, which have been implicated in the actionative to be important in the actiology of asthma. Both ASTH1I and ASTH1I mRNAs are alternatively spliced. Alternative splicing of transcripts has no effect on the open reading frame of ASTH1I and ASTH1I mRNAs are all 5' to the start codon in exon b. In contrast, alternative splicing of ASTH1I transcripts results in 3 different ASTH1I concleic acids are useful as diagnostics to identifying ASTH1 related genes, for identifying expression of the gene in a biological specific gene modifications that minic or modulate activity or expression of ASTH1I and and or ASTH1I and as a miniodises in drug screening for compositions that minic or modulate activity or expression of ASTH1I and anti-ASTH1I or ASTH1I conclude the agence of prophylactic and therapeutic purposes. The intext for modulate or reduce to prophylactic and therapeutic purposes. The intext ASTH1I or ASTH1I concluded by a proteins or active fragmence the intext ASTH1I or ASTH1I and anti-ASTH1I and anti-ASTH1I and anti-ASTH1I and anti-ASTH1I and anti-ASTH1I and altered fragmence within the identification of individual and hereapeutic purposes. The intext ASTH1I or ASTH1I or activity or expression of ASTH1I concluded with the id
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The sequence is that of a bovine microsatellite sequence obtd. by

conserving a library of bovine Mbol DNA fragments of between 250 and 500

conserving a library of bovine Mbol DNA fragments of between 250 and 500

conserving a (TC)15 and a (TC)15 oligonucleotide probe. One out of 50

conserving a (TC)15 oligonucleotide probe. One out of 50

conserving a genome is testimated at >100, 000. The sequence information of for ca. 230 such bovine microsatellites is summarised in the correspond of the microsatellite sequence where used to generate the required PCR primers for in vitro amplification of the correspond constream of the microsatellite sequence where used to generate the microsatellite (using the program OPTIPRIM). The microsatellites may be microsatellity individuals, for parentage testing, and in the genetic conserving of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective for the correct PN for the correct PN for a correct PN for the correct PN fo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method for the inspection of flat

C epithelial cells in which it is judged that flat epithelial cells

c separated from an organism can proceed to flat epithelial center when the

CC 128th base in fibroblast growth factor receptor (FGFR) gene of the cells

CC is mutated from quanine to thymine. Also described is a method for

CC screening treating or preventive agents for flat epithelial cancers in

CC which a candidate substance of treating agent for flat epithelial cancer

CC which the 2128th (exon 17) amino acid in FGFR3 gene is mutated from

CC quanine to thymine or the 697th amino acid is mutated from glycine to

CC quanine to thymine or the 697th amino acid is mutated from glycine to

CC quanine to thymine and that epithelial cell FGFR3 gene after the

CC quanine to thymine and that the 697th amino acid of FGFR3

CC the 2128th base in the flat epithelial cell FGFR3 gene after the

CC application returned to glycine as the indices. The method is used

CC the inspection of flat epithelial cells. The present sequence

CC for the inspection of flat epithelial cells. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inspection of flat epithelial cell, screening of treating or preventive agents for flat epithelial cancers, the treating or preventive agents for flat epithelial cancer.
                                                                                                                                                                                                                                                                                                                                                                                                          Human; fibroblast growth factor 3; FGF3; flat epithelial cell; cancer; flat epithelial cell cancer; PCR primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0.5%; Score 20.6; DB 1; Length 27;

The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
compatream of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
microsatellite (using the program OPTIPRIM). The microsatellites may be
mapping of economic trait loci, or genes involved the determinism of
conomically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ଚ
                                                                                                                                                                                                                                                                                                                                                                                                    The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information for ca. 230 such bovine microsatellite sequence were used to generate the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the microsatellite (using the program OPTIRRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. cc by with an (AC115 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites and mboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information cross-point of the cross-point of the microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and commerce and the microsatellite sequence wased to generate the correspond of the microsatellite sequence wased to generate the microsatellite (using the program OPTIRRIM). The microsatellites may be compared to individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of cenomic ally important traits espon in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN field.)

(GENM-) GENMARK.

Georges M, Massey JM;

WPI; 1992-284684/34.

Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding. Table 7; Page 327; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the appecification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The sequences given in AAQ83938, AAQ83952 and AAQ83940 are used in the construction of an oligonucleotide clamp. The clamp is a comb-type

Example 8; Page 33; 52pp; English.

ö
branched polymer which has 3' termini and was used to bind a target sequence comprising a segment of the HIV pol and nef genes in single stranded or double stranded forms. An oligonucleotide clamp is a compound capable of forming a covalently closed macromolecule or a stable circular complex after specifically binding to the target polymucleotide. Glamps generally comprise one or more oligonucleotide or incular oligonucleotide clamps generally comprise one or more oligonucleotide moieties capable of specific binding to the target molecule and one or more pairs of binding moieties covalently linked to the oligonucleotide polymucleotide, the binding of the oligonucleotide so the target polymucleotide, the binding moieties of a pair are bought into juxtaposition so that they form a stable covalent or non-covalent linkage or complex. The interaction of the binding moieties effectively clamps the specifically annealed oligonucleotide moieties to the target the specifically annealed oligonucleotide moieties to the target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly (dC-dA), (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in marchods for selecting genes in clover/ legume breeding. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf25 which contains the repeat sequence having the formula: (AC)11. (Updated on 25-MAR-2003 to correct PF field.)

The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human uridine diphosphate glucuronosyltransferase gene polymorphism #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; polymorphism; TA repeat; ds; UGT; thymidine-adenine repeat; uridine diphosphate glucuronosyltransferase gene promoter; UGT1A1; drug dosage optimisation; xenobiotic sensitivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0.5%; Score 20.4; DB 1; Length 22; larity 95.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 nucleotide core element which is trademly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs may be purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Simple Sequence Repeat; SSR; clover; microsatellite; genome mapping; trait mapping; marker-assisted selection; gene selection; legume; DNA profiling; breeding; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                 The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter — as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene

Isolated nucleic acid molecules having polymorphisms in known human genee e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 16; Page 131; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 A2 (CYP4501A2), cytochrome P450 A2 (CYP4501A2), aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator (ARNY), catheppsin S (CTSS), cyclooxygenaes 2 (COX), diazepam binding inhibitor (DBI), epoxide hydroxylase 2 (CPAX), classepam binding protein (FLAP), glutathione-S-transferase 12 (GFXI2), histamine-N-methyl

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using cas template a DNA sample containing at least one segment of (I); and cast template a DNA sample containing at least one segment of (I); and cast template a DNA sample containing at least one segment of (I); and cast template a DNA sample containing at least one segment of disease, associated with a gene that include PML. The method is used to identify microsatellite markers, in a disease related gene, that are associated with a predisposition to disease and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hypethermia syndrome in pigs and bramones or transcription factors. The method is simpler, quicker and barticularly less expensive than known methods based on sequencing. This sequence represents a prion protein polymorphic microsatellite marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hyping genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining
Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML, and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a disease related gene, that are associated with a predisposition to diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, commons or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the sheep prion protein (PrP) comprising a polymorphic microsatellite locus. ö The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter — as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is useful in optimising drug desages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter. Human uridine diphosphate glucuronosyltransferase gene polymorphism #4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGTIA1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.

The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine—edenine (TA) repeats in the promoter—as the number of TA repeats correlates with expression of the UGT gene promoter. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenoblotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene
                                                                                                                                                                                                                                                                    Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug desages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human uridine diphosphate glucuronosyltransferase gene polymorphism #5.
                                                                                                                                             Human uridine diphosphate glucuronosyltransferase gene polymorphism #5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; polymorphism; TA repeat; ds; UGT; thymidine-adenine repeat;
uridine diphosphate glucuronosyltransferase gene promoter; UGTIA1;
drug dosage optimisation; xenobiotic sensitivity.

                                                                                                         The present sequence is that of a thiosubstituted oligodeoxynucleic acid (ODN) molecule, ODN 21, including deoxyuridine monophosphates. The invention is based on the discovery that ODNs containing deoxyuridine residues (U-ODNs) have an immunostimulatory effect comparable to, or in many instances greater than, ODNs containing CpG motifs, producing higher numbers of specific T cells to a given antigen. The U-ODNs do not induce the systemic production of pro-inflammatory cytokines and, in contrast to CpG ODNs, are not dependent on a specific motif or a palindromic combining the U-ODN with an antigen strongly increases the potential of the antigen to raise the protection/immune response of a vaccinated individual. An example of the invention demonstrated the generation of a specific immune response against a melanoma-derived peptide (see

The present sequence is that of a thiosubstituted oligodeoxynucleic acid (ODN) molecule, ODN 21, including deoxyuridine monophosphates. The invention is based on the discovery that ODNs containing deoxyuridine residues (U-ODNs) have an immunostimulatory effect comparable to, or in many instances greater than, ODNs containing CpG motifs, producing higher numbers of specific r cells to a given antigen. The U-ODNs do not induce the systemic production of pro-inflammatory cytokines and, in contrast to CpG ODNs, are not dependent on a specific motif or a palindromic Combining the U-ODN with an antigen strongly increases the potential of the antigen to raise the protection/immune response of a vaccinated the antigen terzongly increases the generation of a specific immune response against a melanoma-derived peptide (see ABPSB360) by injection of mice with the peptide in combination with ODN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGTIA1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human uridine diphosphate glucuronosyltransferase gene polymorphism #6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention relates to identifying a rice variety as amplification genetic marker and identifying whether test rice variety is any one of the 32 rice varieties e.g., Kasalath, breath which came or Alayamasari, Italica Livorno, Dunghan Shali, Arroz Da Terra, Fany, USSR22, Nihonbare. The method is useful for identifying rice variety and identifies excellent rice variety. The present sequence represents a base containing SSR sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying rice variety using base sequence containing SSR sequence and amplifying genetic marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          / Match 0.5%; Score 20.4; DB 1; Length 28; Local Similarity 95.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGTIA1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug danged and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene
                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.
individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                           Human uridine diphosphate glucuronosyltransferase gene polymorphism #6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present invention relates to identifying a rice variety as amplification genetic marker and identifying whether test rice variety is any one of the 32 rice varieties e.g., Kasalath, breath which came or Hayamasari, Italica Livorno, Dunghan Shali, Arroz Da Terra, Fany, USR22, Nihonbare. The method is useful for identifying rice variety and identifies excellent rice variety. The present sequence represents a base - containing SSR sequence of the invention.
                                                                                                            Identifying rice variety using base sequence containing SSR sequence and

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 58580; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises

hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attended to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the cucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific nutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence.html

Determining whether the subject has or is predisposed to developing a disease or condition that is associated with an IL-1 inflammatory haplotype, useful for treating inflammation, comprises detecting an IL-1 allele

Claim 18; Fig 10A; 96pp; English

cc information relates to the luterlication and use of yearerlication information from the human interleukin 1 (IL-1) gene cluster including the structure and organisation of novel IL-1 like genes found within the the structure and organisation of novel IL-1 like genes found within the the structure and ostenisates of the polymorphisms (single nucleotide polymorphisms).

CC SNPs) and associated haplotypes within these genes. The invention also crelates to the use of these polymorphisms and haplotypes for predicting relates to the use of these polymorphisms and haplotypes for predicting inflammatory disease) and for treating IL-1 associated inflammatory phanotypes. IL-1 is a primary inflammatory cytokine and has been conficiently functionally similar molecules, IL-1 alpha and IL-1 beta of implicated in mediating both acutes molecules, IL-1 alpha and IL-1 beta, are encoded by genes ILA and ILLB. A third gene of the family (ILIRN) are encoded by genes ILA competes for receptor binding with IL-1 alpha and IL-1 beta. The IL-1 gene cluster is on the long arm of chromosome configurable and inclusion and inclusion with inclusion and inclusion and inclusion or orteopathic activity. In addition, the sequences encoding the IL-1 corporating and electronic partorpoic or proteins may be useful for gene therapy. The methods and polymucleotide proteins may be useful for diagnosing and treating an inflammatory disease, for example arthritis, heapeatic inflammation, chronic obstructive in the new arrangement of inclusion and including a single nucleotide polymorphism of the inclusion, in the harmonic polymorphism of the inclusion in the back in the polymorphism of the inclusion in the back in the polymorphism of the inclusion in This invention relates to the identification and use of genetic invention in the human ILIRN gene.

The pharmaceutical preparations comprising agents which inhibit the synthesis and expression of FGFR3 and so have an anti-proliferation effect on carcinomas can be used to treat cancer. Two primers (AAA54426, AAA54838) were used in PCR reactions on urine samples to detect the S249C mutation in FGFR3
point. The immortalized HPC can be used in a screening method for a hair growth agent, by culture of immortalized HPC in the presence of a substance to be tested and observation of the growth of the immortalized HPC. HPC is also used in development of hair growth stimulating agents. The present sequence represents a PCR primer, which is used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Diagnosing carcinoma e.g. bladder or cervix carcinomas in a biological sample such as tissue, bone marrow or body fluid, preferably from animal or human, by identifying fibroblast growth factor receptor 3 mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fibroblast growth factor 3 receptor; FGFR3; mutant; detection; cancer;

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3) ACH, UTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an
                                                                                                                                                                                                                                                                                                                     /mod_base= OTHER

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, UTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, hyperproliferative disorders or skin. They are useful as research reagents, therapeuties, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /mod_base= OTHER

Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breader or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to antisense compounds targetted to a nucleic acid
hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human PGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; antisense; fibroblast growth factor receptor 3; prophylaxis;

molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, UTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /mod_base= OTHER

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, VIK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breach or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "Phosphorothioate backbone; All cytidine residues

                                                                                                                                                                                                                                                                                                                                                                                                                 ઠે
                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                    ö
                                                                         The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3) ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or conditions hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /mod_base= OTHER

                                                                                                                                                                                                                                                                                                           The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3) ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to chucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1. .20

                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                      The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGRP-3) ACH, JTK4 and CBK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGRP-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, broagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGPR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; antisense; fibroblast growth factor receptor 3; prophylaxis; developmental disorder; hyperproliferative disorder; antisense therapy; FGFR-3; ACH; JTK4; CEK2; cancer; phosphorothioate; ss.
                                                                                  Novel compound targeted to a nucleic acid molecule encoding fibroblast growth factor receptor 3, useful for inhibiting the expression of the receptor and for treating an animal having cancer or developmental
                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, hoper least to skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /mod_base= OTHER

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGRF-3, ACH, TYK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGRF-3, ACH, TVR4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophlaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /mod_base= OTHER

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGPR-3. ACH, JTK4 and CEK2) to inhibit the expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, hyperproliferative disorders, especially cancer of colorectal, bladder, broagents, therapeutics, prophylaxis, kits and disgnostics, and as tools in differential and/or combinatorial analyses to elucidate expression in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, antisense, fibroblast growth factor receptor 3, prophylaxis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           움
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, hyperproliferative disorders, especially cancer of colorectal, bladder, broagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, antisense; fibroblast growth factor receptor 3; prophylaxis;

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostiss, and as tools in differential and/or combinatorial mantyes to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an
                                                                                                                                                                                                     /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGP) receptor 3 (also known as FGRP-3, ACH, TVK4 and CBK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or conditions hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                      /note= "Phosphorothioate backbone; All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel compound targeted to a nucleic acid molecule encoding fibroblast growth factor receptor 3, useful for inhibiting the expression of the receptor and for treating an animal having cancer or developmental disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3) ACH, WITK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, hopen, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to calucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence, is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                     /mod_base= OTHER

Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to clucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                              /note= "Phosphorothioate backbone; All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel compound targeted to a nucleic acid molecule encoding fibroblast growth factor receptor 3, useful for inhibiting the expression of the receptor and for treating an animal having cancer or developmental disorder.

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, TKY4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues.
                                                                                                                                                                                                                                                                                                         /mod_base= OTHER

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, UTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperporliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial naalyses to calucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an
                                                                                                                                                                                                                                                                                                                                                                                      /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or Skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues.

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder,
                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /mod base OTHER

as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or conditions hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel compound targeted to a nucleic acid molecule encoding fibroblast growth factor receptor 3, useful for inhibiting the expression of the receptor and for treating an animal having cancer or developmental
bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tool in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                     Gaps

                  The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGRF-3). ACH, JTK4 and CEKZ) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGRF-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /mod_base= OTHER

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially caner of colorectal, bladder, hyperproliferative disorders, especially caner of colorectal, bladder, horse, unique, cervical, breaptorial, kits and diagnostics, and as tools in differential and/or combinatorial analyses to chucidate expression in differential and/or combinatorial analyses to chucidate expression in differential and/or combinatorial analyses to chucidate expression. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /mod_base= OTHER
